Abstract
Suraksha Setu is a proposed **Smart Public Safety System** designed for the Smart India Hackathon 2025 under the *Public Safety & Security* theme. The solution addresses critical challenges such as delayed emergency response, weak reporting mechanisms, overloaded police helplines, and inefficient evidence handling.

The platform integrates a **citizen mobile app**, an **AI/ML incident analysis engine**, and a **police dashboard**. Key features include:

- **AI/ML-based incident categorization** and urgency detection
- **SOS panic button** for instant alerts
- **Blockchain-secured evidence vault** for tamper-proof storage
- **Hotspot prediction** via data analytics
- **Volunteer & community responder network**

The technical stack leverages React/Flutter for frontend, Node.js/Django for backend, Python (NLP & predictive analytics), GIS mapping APIs, blockchain for data security, and cloud hosting for scalability.

Suraksha Setu is technically feasible, scalable across states, and capable of integrating with police/government systems. Risks like data privacy and adoption barriers are mitigated through blockchain-based security, citizen awareness campaigns, and SMS-based offline fallback.

Impact & Benefits: Faster emergency response, improved safety assurance, reduced cyber fraud losses, and optimized use of public safety resources. Real-life cases—such as delayed cybercrime reporting, non-functional CCTV networks, and “golden hour” accident delays—highlight its potential to save lives and enhance law enforcement efficiency.
